

Running Windows Update

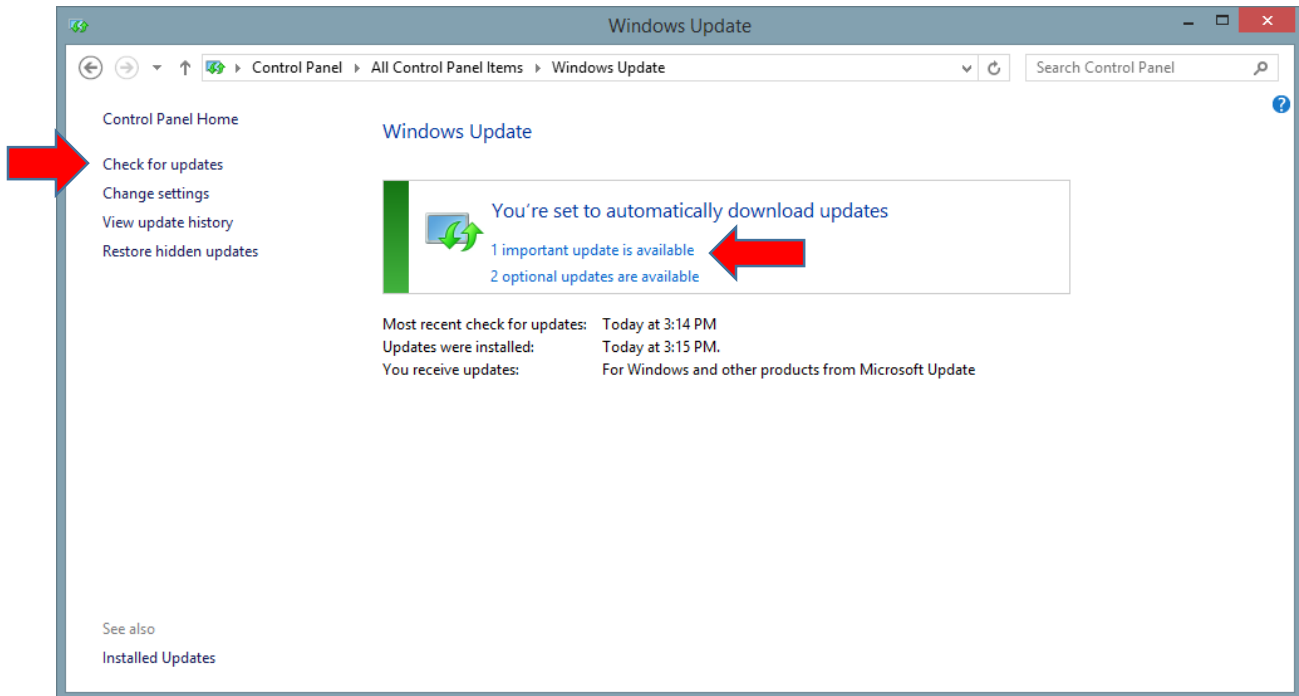

Note: you will likely be prompted to restart your PC at the end of this process so save any work in progress before beginning.

Go to the Start menu (click on the Windows orb in the bottom, left corner) and select “Control Panel” in the right column.

In Control Panel be sure that the “View By” settings is set to “Large Icons”

Select “Windows Update” from the bottom of the list

Select “Check for updates” from the list on the left (even if you have updates listed already)
Windows will run a search for the most recent system updates.

Once it is done searching click the “important updates are available” link.

Click the “Install” button to install all important updates.
It is not necessary to install “optional updates”

Restart your PC if prompted.

Highly Recommended: After rebooting your PC, repeat the listed process. Some updates won’t run until previous updates are applied.
